

How to use DeoVR\HereSphere in XTP remotely

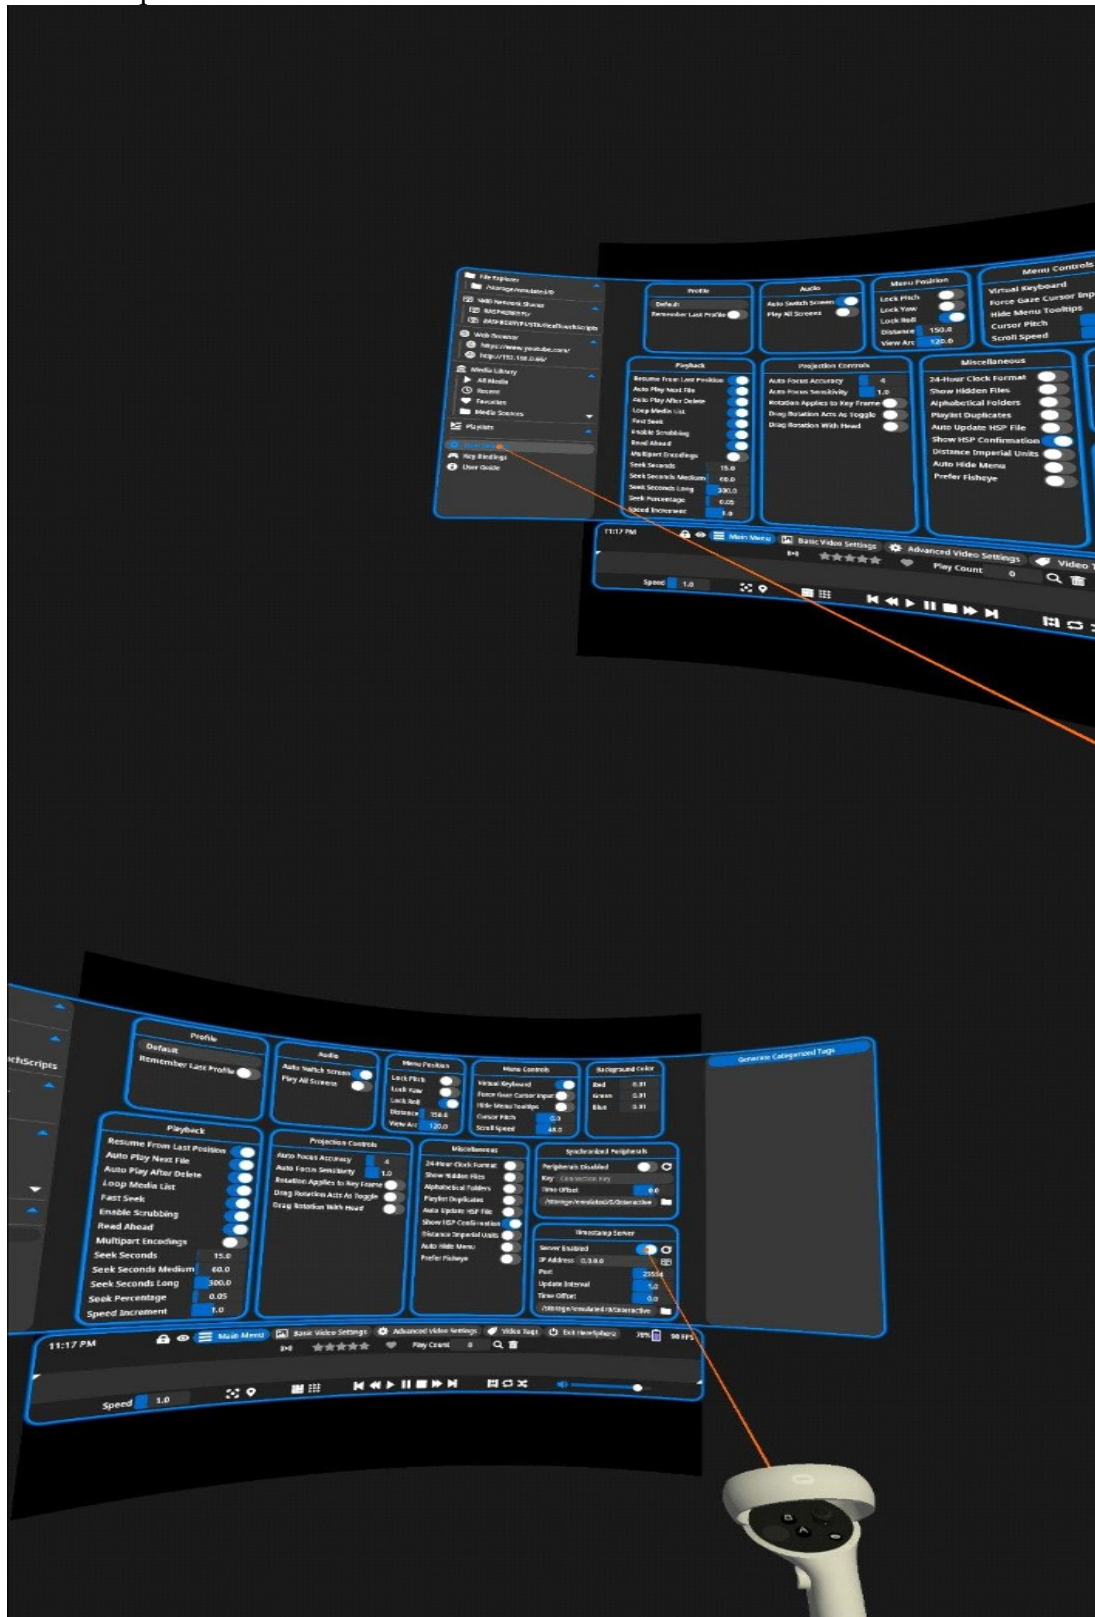

(The terms DeoVr and Heresphere are mostly used interchangeably throughout this document)

- Enable remote control in DeoVR or HereSphere

For Deo VR:

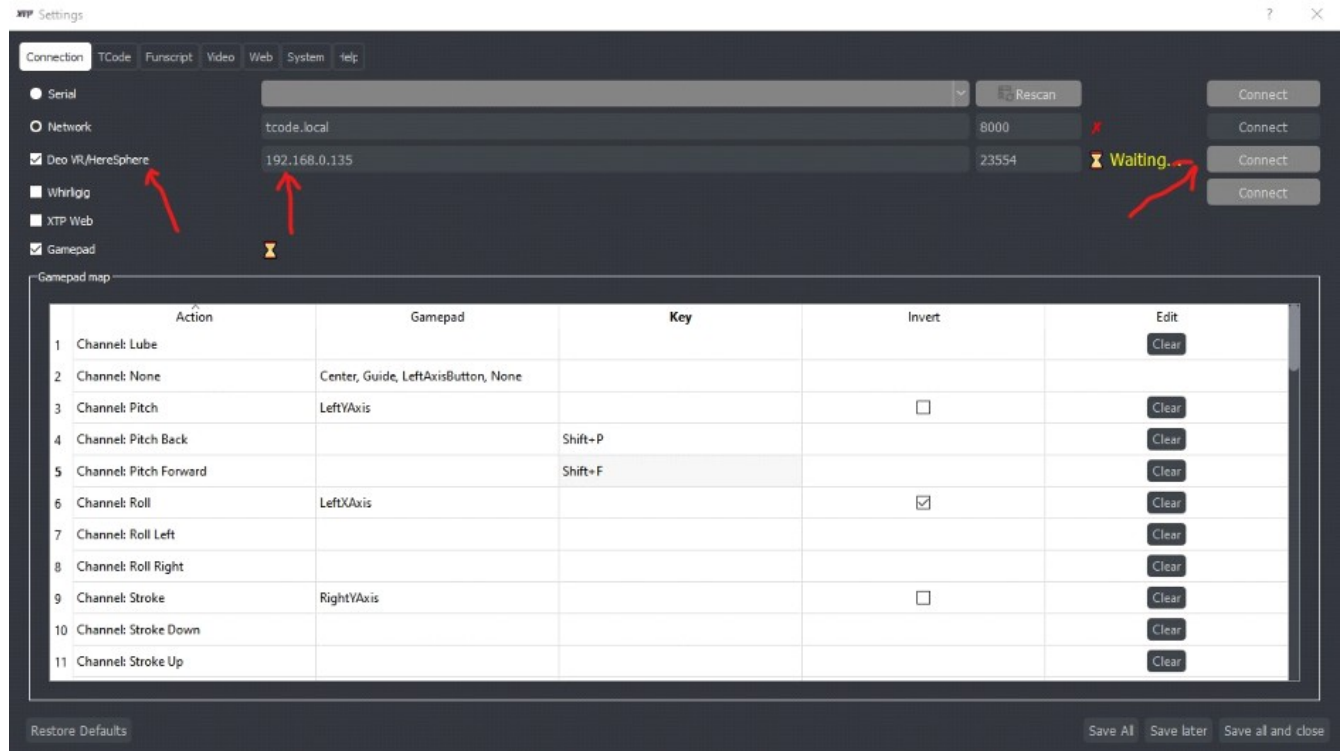

For HereSphere:

Find the IP address of the device DeoVR/HereSphere is installed on to. (Your router web interface is usually the easiest way) This is harder to describe because every router interface is different.

Refer to your router documentation.

On the Meta Quest you can look in the wifi settings to find the IP address now. Should probably statically set this IP somehow as IT WILL CHANGE by default.

- Enable DeoVR/HereSphere in the XTP settings by checking the checkbox that says Deo VR/HereSphere
- Enter the IP address you found in step 2 in to XTP settings
- Click connect
- Launch Deo VR/HereSphere

At this point XTP should connect to DeoVR/HereSphere.

Syncing XTP with an external player

There are two ways to sync your scripts from a remote VR player.

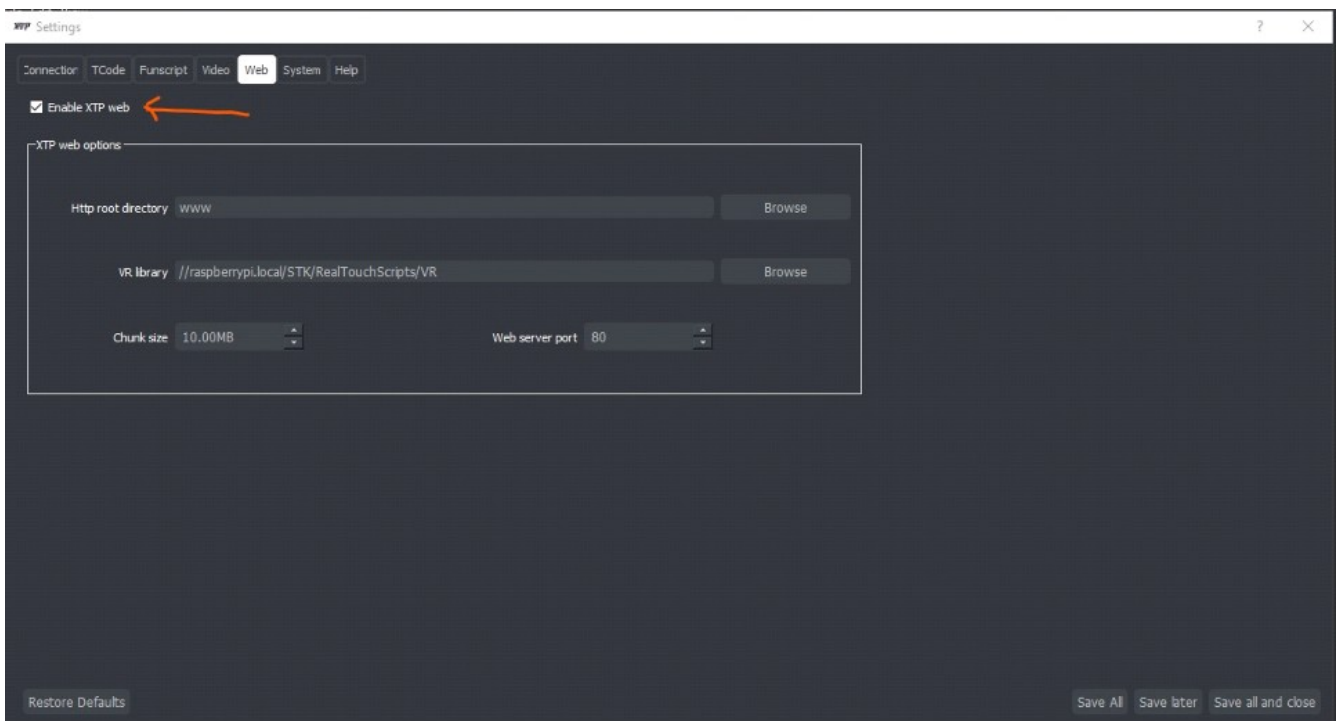

The easy way: Enable XTPweb and stream your videos through http.

The Not so easy way: Cross your fingers the streaming method passes back a copy of the file name in the media path that the funscript is named and in your library.

The two methods are detailed below.

The easy way

Enable XTP Web on the “Web” tab in XTP settings **LEAVE THE REST AT DEFAULT UNLESS YOU KNOW WHAT IT MEANS.**

Input <http://<IP Address of XTP machine>> into the DeoVR or HereSphere web browser. (only http is supported at the time of this writing)

Wait for your media to load verify your devices are connected then click n go.

XTP will find the script if its along side the video with the same name at the same URL (Folder).

Side note, as of XTP v0.28 you can place your own thumb nail file in the same directory named "videoname.jpg" (valid extensions ".jpg" << ".jpeg" << ".png" << ".jfif" << ".webp")

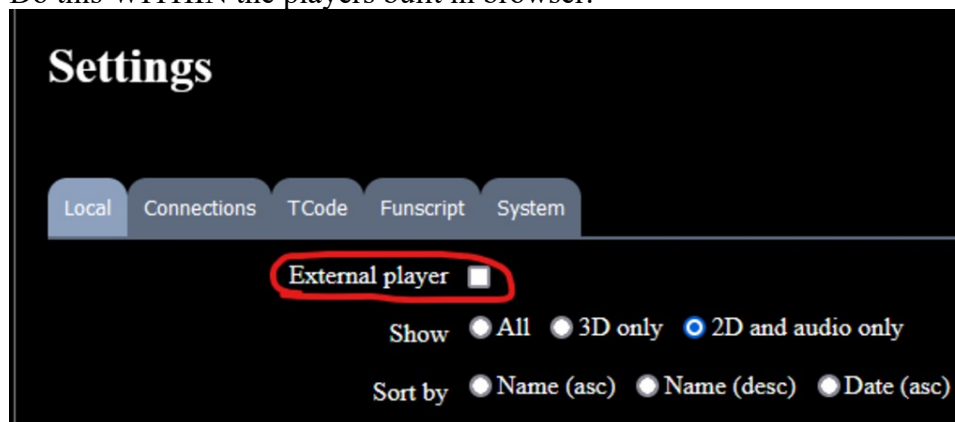

To avoid the awkward in video VR thumbnails XTP will generate.

Side sidenote: You can either keep your VR media separate from the 2D media and select it in the Web settings.

Or you can name your VR media in accordance with DeoVR naming scheme outlined in section 9. on this site. <https://deovr.com/app/doc>

Make sure to check the "External streaming" checkbox for DeoVR/Heresphere media players.

Do this WITHIN the players built in browser.

Now click a video from the main XTP Web interface and enjoy.

The Not so easy way

Note: This method is currently invalid when using XTP in headless mode

When you start a video in VR if a file with same name as the video that the VR player sends (Depending on where the video is, The streaming method sometimes sends an internally generated filename) is not found in the same directory or root of the library folder you have currently selected in XTP, you will get a pop up on the computer XTP is on asking you to select the funscript you want to sync to the video.

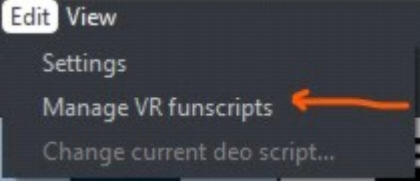

XTP will save this funscript location in your XTP settings for next use.

If for some reason you want to change this stored location.

While the video is playing in DeoVR, navigate to Edit > Change current deo script...

and select a new funscript.

You can also view and edit all your stored scripts with the new “Manage VR Funscripts” interface.

The screenshot shows a dark-themed menu with options: Edit, View, Settings, Manage VR funscripts (highlighted with an orange arrow), and Change current deo script... Below this is a window titled 'XTP Library exclusions' with a table of funscripts.

At the bottom of the table are buttons: Reset, Save, Discard, Close.

For HereSphere DLNA will be similar as above but HereSphere offers SMB/Windows FileShare streaming making the process for XTP to find scripts easier. The scripts just need to be inside the chosen XTP Library folder somewhere. XTP will search every file until it finds one that matches the video name.
